

Figure 1: Research study design timeline for a controlled experiment with two IV (1. groups: waitlist, intervention; 2 time point of data collection: pre, post and follow-up points) and data collected at three time points for these dependent variables: SR-Attn survey (school, home), BASC Attn survey (school, home), executive functioning test.

Note that we also took observation data DURING the 7 week interventions – but this isn't shown in figure.
